EPIDEMIOLOGY

SOURCE OF EVENT OR ORIGIN OF INFECTION

- Contact with wild species
- Unknown or inconclusive

EPIDEMIOLOGICAL COMMENTS

Highly pathogenic avian influenza (HPAI) H5N1 Eurasian lineage goose/Guangdong clade 2.3.4.4b has been confirmed in samples from dairy cattle in Arizona (AZ), California (CA), Colorado (CO), Idaho (ID), Iowa (IA), Kansas (KS), Michigan (MI), Minnesota (MN), Nevada (NV), New Mexico (NM), North Carolina (NC), Ohio (OH), Oklahoma (OK), South Dakota (SD), Texas (TX), Utah (UT), and Wyoming (WY). Updates to the detections of highly pathogenic avian influenza (HPAI) in livestock can be found at: <https://www.aphis.usda.gov/livestock-poultry-disease/avian/avian-influenza/hpai-detections/hpai-confirmed-cases-livestock>. On 24 April 2024, The Animal and Plant Health Inspection Service (APHIS), United States Department of Agriculture issued a federal order requiring pre-movement testing and reporting of highly pathogenic avian influenza (HPAI) in livestock.

QUANTITATIVE DATA SUMMARY

MEASURING UNIT

Animal

AFFECTED POPULATION DESCRIPTION

Feral domestic cats (Felis catus). HPAI H5N1 clade 2.3.4.4b was detected in two feral cats that were found dead and submitted by a local veterinarian for testing due to affected HPAI dairies in the county. The location of these cats was not directly associated with a known HPAI affected dairy farm or poultry farm. Note 26/07/2024: Upon laboratory records review, start date for this outbreak was corrected to 4/17/2024.

Domestic cats (Felis catus) at a backyard premises. Clinical signs included labored breathing, anorexia, depression and dehydration. Cats were housed adjacent to HPAI positive domestic chickens (WOAH non-poultry premises). Highly pathogenic avian influenza (HPAI) H5, Eurasian lineage goose/Guangdong clade 2.3.4.4b was confirmed on swabs taken from both cats. N1 was confirmed on one cat but N typing could not be confirmed on the second cat.
